

ZYROO INTERNSHIP PROGRAM

DATA ANALYTICS INTERNSHIP

WEEK 2

Ride Analytics & Revenue Intelligence Platform

Task 01: Build a Simple Ride Analytics Dashboard

Difficulty: Beginner **Estimated Time:** 4–6 hours

Objective: Use a small ride dataset to clean the data, calculate a few simple numbers, and make an easy Power BI dashboard.

1. Real-World Problem

- Ride companies have data about rides, fares, locations, and payments.
- Your job is to turn this raw data into a simple dashboard that answers basic business questions.

2. Week 2 Requirements

- Get a small ride-hailing dataset.
- Open and understand the data.
- Remove obvious duplicate or empty rows.
- Calculate a few basic KPIs.
- Create a simple Power BI dashboard.
- Show rides and revenue using easy charts.
- Write a short summary of what you learned.

3. Data Collection & Understanding

- Use a ride dataset with simple columns such as:
- **Ride ID, Date, Pickup Location, Drop-off Location, Fare, Payment Method, Ride Status, Rating.**
- For this beginner task, you do not need a large dataset. A small sample is enough to learn the process.
- Example row: R001 | 02-09-2026 | Lahore | DHA | 450 | Cash | Completed | 5

4. Data Cleaning

- Check for empty values.
- Remove duplicate ride IDs.
- Make sure Fare contains numbers.
- Make sure Date is in a correct date format.
- Remove clearly invalid rows, such as a negative fare.
- Keep the cleaning simple. Do not spend time on advanced data processing.

5. Basic KPI Analysis

- Calculate only these easy KPIs:
- **Total Rides**
- **Completed Rides**
- **Cancelled Rides**
- **Total Revenue**
- **Average Fare**
- **Average Rating** (if available)

6. Build a Simple Dashboard

- Use Power BI.
- Create 4–5 KPI cards at the top.
- Add simple charts:
 - Rides by Date
 - Revenue by Date
 - Rides by Payment Method
 - Rides by Status
 - Top Pickup Locations

7. Simple Dashboard Example

- **Total Rides:** 100
- **Completed Rides:** 85
- **Cancelled Rides:** 15
- **Total Revenue:** PKR 42,000
- **Average Fare:** PKR 420

- The numbers above are only an example. Your dashboard should use the numbers from your dataset.

8. Simple Questions to Answer

- How many rides are there?
- How much revenue was made?
- Which payment method is used most?
- Which pickup location has the most rides?
- How many rides were cancelled?
- What is the average fare?

9. Recommended Beginner Tools

- **Excel** — to look at and clean the data.
- **Power BI** — to create the dashboard.
- **Python/Pandas** — optional if you already know Python.
- **Git + GitHub** — to submit your work.

10. Simple Project Structure

- ride-analytics/
 - data/
 - powerbi/
 - screenshots/
 - README.md

11. Basic Flow

- **Dataset → Clean Data → Calculate KPIs → Power BI → Dashboard → Simple Insights**

12. Required Deliverables

- Cleaned dataset.
- Power BI dashboard.

- 4–5 simple KPIs.
- Basic charts.
- 2–5 short business insights.
- GitHub repository.
- README with dataset, steps, and dashboard screenshots.

13. GitHub Submission

- Create a GitHub repository.
- Upload the dataset or provide its source link, Power BI file, screenshots, and README.
- Never upload passwords, API keys, or other secrets.

14. Week 2 Success Criteria

- The task is complete when you can show:
- **Collect** → **Clean** → **Calculate** → **Dashboard** → **Explain**
- You should be able to explain your dashboard in a few simple sentences.

Beginner Checklist

- I have a ride dataset.
- I checked the columns and data.
- I removed obvious duplicates/invalid rows.
- I calculated the basic KPIs.
- I created a Power BI dashboard.
- I added simple charts.
- I wrote a few insights.
- I uploaded my work to GitHub.
- I added a simple README.
- I can explain my dashboard.
